Studio/SoundForge Pro Audio Package | Sony | Product Information The list of supported Sound Forge file types is made up of the file formats that were included with Sound Forge's predecessor, Sonic Foundry's Sound Forge 6. Sound Forge can open and edit the following file types:. Unzip the package to your hard drive.exe may be the default file type, but a different format may be listed.Q: C++ how to define constructor template-dependent member I have an object that has multiple, template-dependent parameters. I am trying to reduce the amount of code I have to write for the specific implementations of the constructor. For the sake of getting a simple working example, please see the following snippet of code. #include struct person { int age; int birthday; std::string name; }; template person::person(Arg1 arg1, Arg2 arg2) { age = arg1; birthday = arg2; name = arg1+" "+arg2; } template person::person(int arg1, int arg2) { age = arg1; birthday = arg2; name = "No name"; } int main() { person jessica(50, 1985); return 0; } As stated in the comments, I am getting a compiler error when I try to compile this. However, I don't want to be able to do something like this: person jessica(30, 35); What is the best way to make the first constructor I defined compile? The main issue I'm having is that I don't know how to define a constructor template such that the compiler can deduce the template parameters. A: You should pass the types as template parameters to the constructor. As Alex stated, a constructor must be able to deduce its template parameters from the arguments. template person::person(Arg1 arg1, Arg2 arg2) : age{arg1},
